What I've learned from these videos is that open source has been a cornerstone of advancements in software development. Much of the software behind the world's biggest companies is open to the public, from the source code for Facebook's user interface to Google's Android, meaning anyone can download it and build upon it. Open source's rise in the 1980s along with the takeoff of Linux in the 1990s goes to show how much impact it has had. In the second video, for example, it's noted that even Walmart has open sourced its cloud management platform. Before open source, large software projects were handled by private companies that treated software as something to hoard and sell. It wasn't until the 1980s that open source gained traction, and after Linux was released in 1991, it gradually won over major companies and now today, 99% of Fortune 500 companies use open source.
